Broken Data Team

Energy efficiency

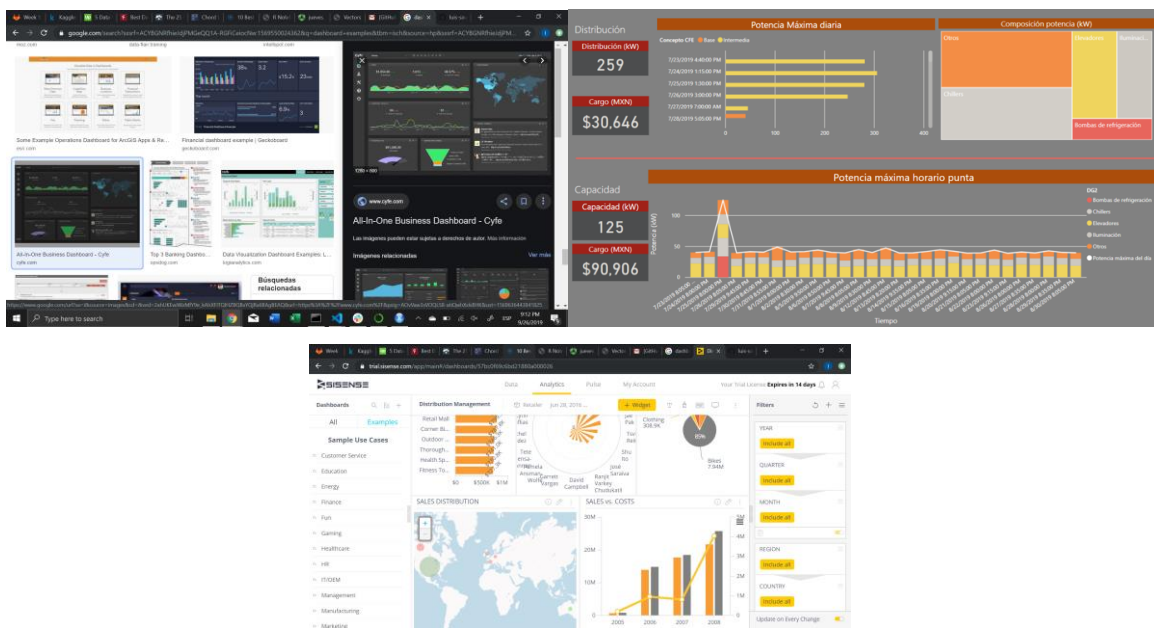

Brief Articulation

Our Project is based on the premise that electricity consumption is often overlooked on companies. The idea of it is to have a consumption history for keeping track of the electrical bills. This will help to have a clear understanding of the consumption habits for said companies and to promote a responsible use of electrical energy. The practical case study will take into account the electricity consumption of two separate buildings owned by the same company and will have the result of different views that will help them to identify consumption peaks and the factors that caused them.
